React- Ex2 – State

1. Create a component called PersonComp with the following structure :
    -   A span tag that shows the person's name
    -   A span tag that shows the person's age

    The initial data is been set in the constructor

    Every click on "Swap" will swap the values on the html

2. Create A component with a text box (for entering numbers) and a button.
    The component also presents a total of numbers.
    Every button press will add the supplied number to the total.

3. Create a component with 2 text boxes . Present their data an separated
    elements . Add a button. A click on the button will swapped between the
    age and the name. If one of textboxes will contains more than 4 chars – the
    texts will be swapped as well.

4. Add to the Component a checkbox and two radio (radio1 & radio2) buttons.
    A selection of one radio button will checked the checkbox. A selection of
    the other radio button will un-checked the checkbox.
